

JavaScript Interview Questions with Answers and Examples

1. What is Arrow Function in JavaScript?

Arrow function is a shorter syntax to write functions in JavaScript.

Example:

```
const add = (a, b) => a + b;
```

2. Difference between Parameter and Argument?

Parameter is variable inside function. Argument is value passed to function.

Example:

```
function test(name) {}  
test('Sri');
```

3. Why use break in loop?

break is used to stop loop execution immediately.

Example:

```
if(i === 5){ break; }
```

4. What does % modulus operator do?

It returns remainder value after division.

Example:

```
10 % 3 = 1
```

5. Why is 1 not a prime number?

Prime number should have exactly 2 factors. Number 1 has only one factor.

6. Difference between return and console.log()?

return sends value back from function. console.log() prints value on console.

7. What is function scope?

Variables declared inside function can be accessed only inside function.

8. What is the use of let?

let is used to declare block-scoped variables.

9. Difference between == and ===?

== checks value. === checks value and datatype.

Example:

5 == '5' → true

5 === '5' → false

10. How does loop work in prime logic?

Loop checks whether number is divisible by other numbers.

11. What is callback function?

A function passed as argument to another function.

12. Why use callback functions?

Used for asynchronous operations and reusability.

13. What is synchronous callback?

Callback that executes immediately.

14. What is asynchronous callback?

Callback that executes after delay or event.

15. What is callback hell?

Nested callbacks making code difficult to read.

16. Can function be passed as argument?

Yes. JavaScript functions are first-class functions.

17. Difference between normal function and callback function?

Callback function is passed into another function.

18. Which methods use callback?

map(), forEach(), filter(), setTimeout().

19. What is anonymous callback?

Callback function without name.

20. What is arrow callback function?

Callback written using arrow function syntax.

21. What is closure?

Inner function remembers outer function variables.

22. Why closures are used?

Used for private variables and memory preservation.

23. What is nested function?

Function inside another function.

24. What is lexical scope?

Inner function accessing outer variables.

25. Can closure maintain data?

Yes. Closure preserves variable values.

26. Why return inner function?

To access closure outside function.

27. Does closure preserve memory?

Yes.

28. Real-time use of closure?

Counters, carts, balance systems.

29. What is private variable?

Variable accessible only inside function.

30. Difference between local variable and closure variable?

Closure variables stay in memory.

31. What is object in JavaScript?

Object stores key-value pairs.

32. What is for...in loop?

Used to iterate object keys.

33. How to access object value dynamically?

Using bracket notation: object[key].

34. Difference between dot and bracket notation?

Dot notation uses fixed key. Bracket notation uses dynamic key.

35. Why use for...in?

To iterate object properties dynamically.

36. Can for...in work for arrays?

Yes, but mainly used for objects.

37. How to print object keys?

Using for...in loop.

38. How to print object values?

Using object[key].

39. What are object properties?

Keys and values inside object.

40. Real-time object examples?

Student details, employee details, product details.

41. What is array?

Array stores multiple values.

42. What is `forEach()`?

Used to iterate array values.

43. What is `map()`?

Creates new modified array.

44. Difference between `map()` and `forEach()`?

`map()` returns array. `forEach()` does not return.

45. What is iteration?

Accessing elements one by one.

46. Can `map()` modify data?

Yes.

47. What is nested iteration?

Loop inside another loop.

48. How does `forEach()` work?

Automatically iterates array values.

49. What is array of objects?

Objects stored inside array.

50. Real-time use of `map()` and `forEach()`?

Used in API data display, product cards, and user lists.
