

JavaScript Practice Questions

1. Prime Number using Arrow Function

1. Write a prime number program using arrow function.
2. Check whether a number is prime or not using function parameter.
3. Find prime numbers between 1 to 50 using arrow function.
4. Create a function to count total prime numbers in an array.
5. Check prime number using for loop and arrow function.
6. Print 'Prime' or 'Not Prime' using callback inside arrow function.
7. Find smallest prime number in an array.
8. Create a reusable prime checker function.
9. Find all prime numbers between two user inputs.
10. Create a menu-driven prime number checker using functions.

2. Callback Function

1. Create a student result system using callback function.
2. Build a calculator using callback functions.
3. Create a food order system using callback.
4. Create a login system using callback function.
5. Pass one function inside another function and print result.
6. Create even/odd checker using callback function.
7. Create age validation using callback function.
8. Create employee salary bonus system using callback.
9. Build a movie ticket booking confirmation using callback.
10. Create asynchronous callback using setTimeout().

3. Closure Program

1. Create a bank balance system using closure.
2. Create a counter application using closure.

3. Build a private variable using closure.
4. Create a shopping cart count using closure.
5. Build a score tracker using closure.
6. Create a login session counter using closure.
7. Create a function returning another function.
8. Create a closure program to store total marks.
9. Build a withdrawal system using closure.
10. Create a product stock management system using closure.

4. Object + for...in Loop

1. Create a student object and print all details using for...in.
2. Create an employee object and print keys and values.
3. Create a product object and print product details.
4. Create a car object and display all properties using for...in.
5. Check student pass/fail using object marks property.
6. Count total properties in an object using for...in.
7. Create a mobile object and print specifications.
8. Create a company object and iterate values dynamically.
9. Create a user profile object and display all data.
10. Create a book object and print object entries using loop.

5. Array + map()/forEach() + for...in

1. Create an array of students and print details using forEach().
2. Use map() to display employee data from array of objects.
3. Print pass/fail for all students using array iteration.
4. Create product array and print all product details using for...in.
5. Create movie objects array and display movie details.
6. Use map() to print even and odd numbers from array.
7. Create user array and print user information dynamically.
8. Create employee salary array and print bonus eligibility.
9. Create array of mobiles and display specifications.

10. Iterate nested objects inside array using `forEach()` and `for...in`.
